

Cloud Deployment and Service Models

Y. V. Lokeswari - AP/ CSE
SSN College of Engineering

Reference: Distributed and Cloud Computing
K. Hwang, G. Fox and J. Dongarra

Overview

- Cloud Deployment Models
 - Public Cloud
 - Private Cloud
 - Hybrid Cloud
 - Community Cloud
- Cloud Service Models
 - Infra-structure as a Service (IaaS)
 - Platform as a Service (PaaS)
 - Software as a Service (SaaS)
- Cloud Computing Challenges

Is Cloud environment
centralized or distributed

???

Some argue as Centralized
And
Some argue as Distributed

Centralized and Distributed computing

- Cloud computing is indeed practicing **distributed parallel computing** over datacenter resources.
- All **computations** associated with a **single cloud application** are still **distributed** to **many servers** in **multiple datacenters**.
- Commercial cloud providers such as **Amazon, Google and Microsoft** created their platforms to be **distributed geographically**.
- These centers may have to communicate with each other around the globe

Deployment Models in Cloud

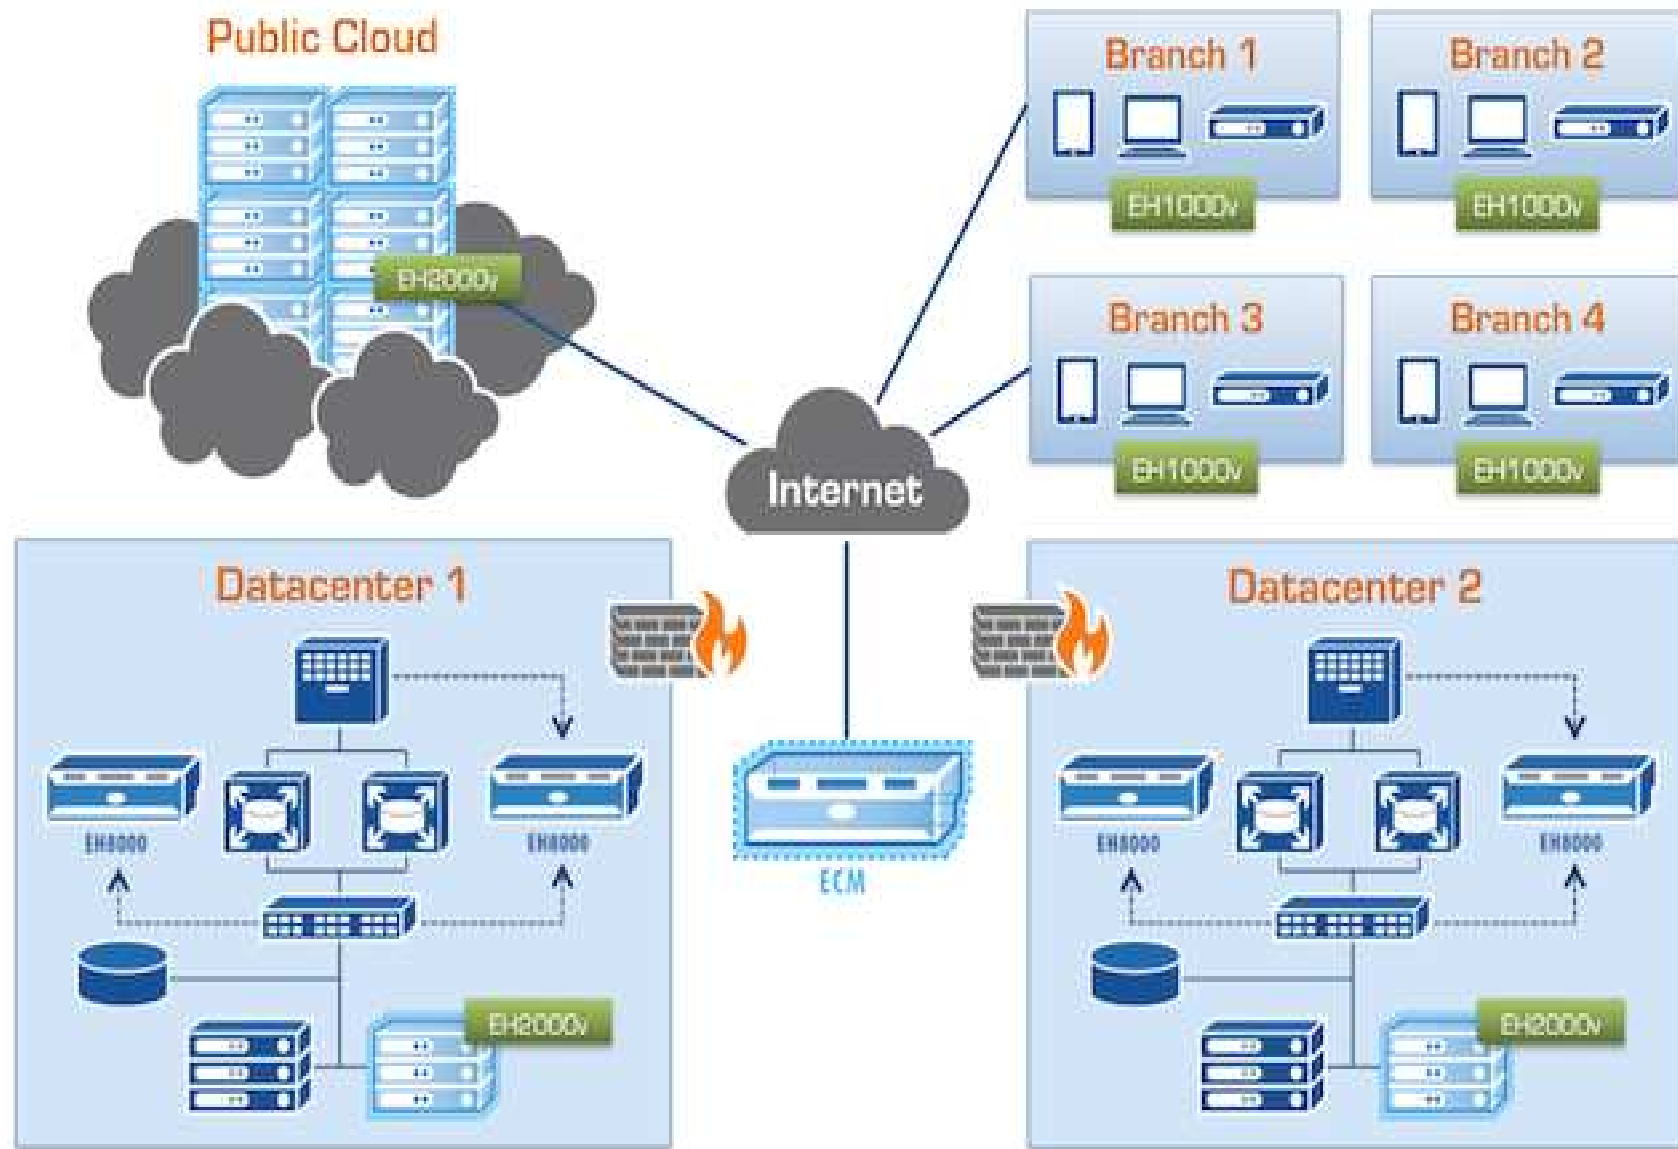

There are 4 Deployment models

1. Public Cloud
2. Private Cloud
3. Hybrid Cloud
- 4 .Community Cloud

Public Cloud

- **Public cloud** is built over the **Internet**, which can be accessed by any user who has paid for the service.
- Public clouds are owned by **service providers**.
- They are accessed by **subscription**.
- Commercial companies have built public clouds. They are
 - Google App Engine,
 - Amazon AWS,
 - Microsoft Azure,
 - IBMBlue Cloud, and
 - Salesforce Force.com.
- They offer a publicly accessible **remote interface** for **creating** and **managing VM instances within** their proprietary **infrastructure**.

Public Cloud Diagram

Private Cloud

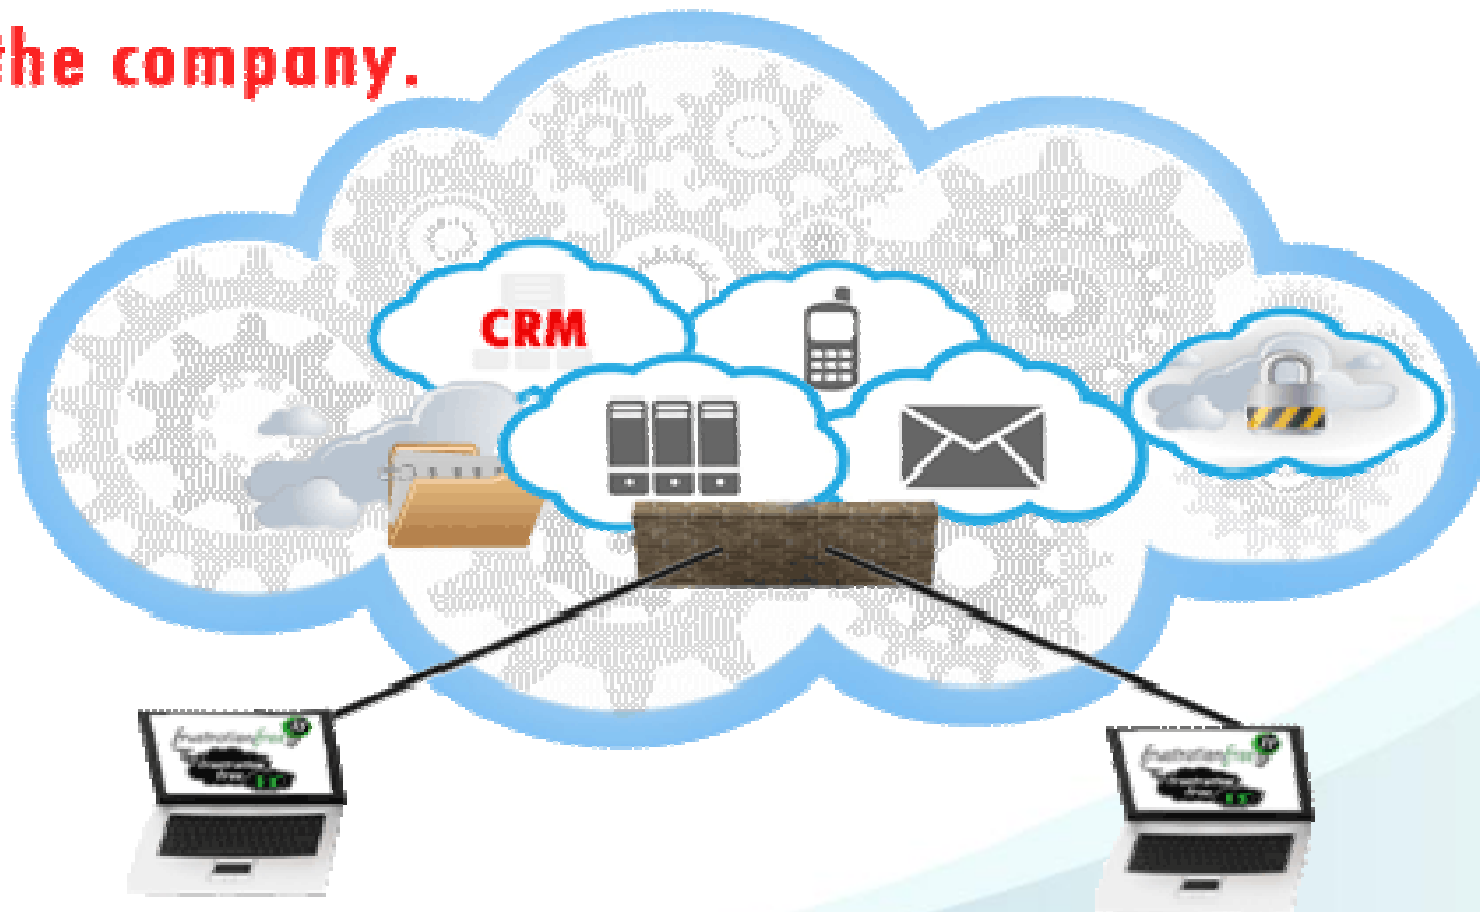

- **Private** cloud is built within the domain of an **intranet** owned by a **single organization**.
- They are **client owned** and managed.
- Their access is **limited** to the **owning clients** and their **partners**.
- Their deployment was **not meant** to **sell capacity** over the **Internet** through publicly accessible interfaces.
- Private clouds give local users a **flexible** and **agile** private **infrastructure** to run service **workloads within** their **administrative domains**.

Problem

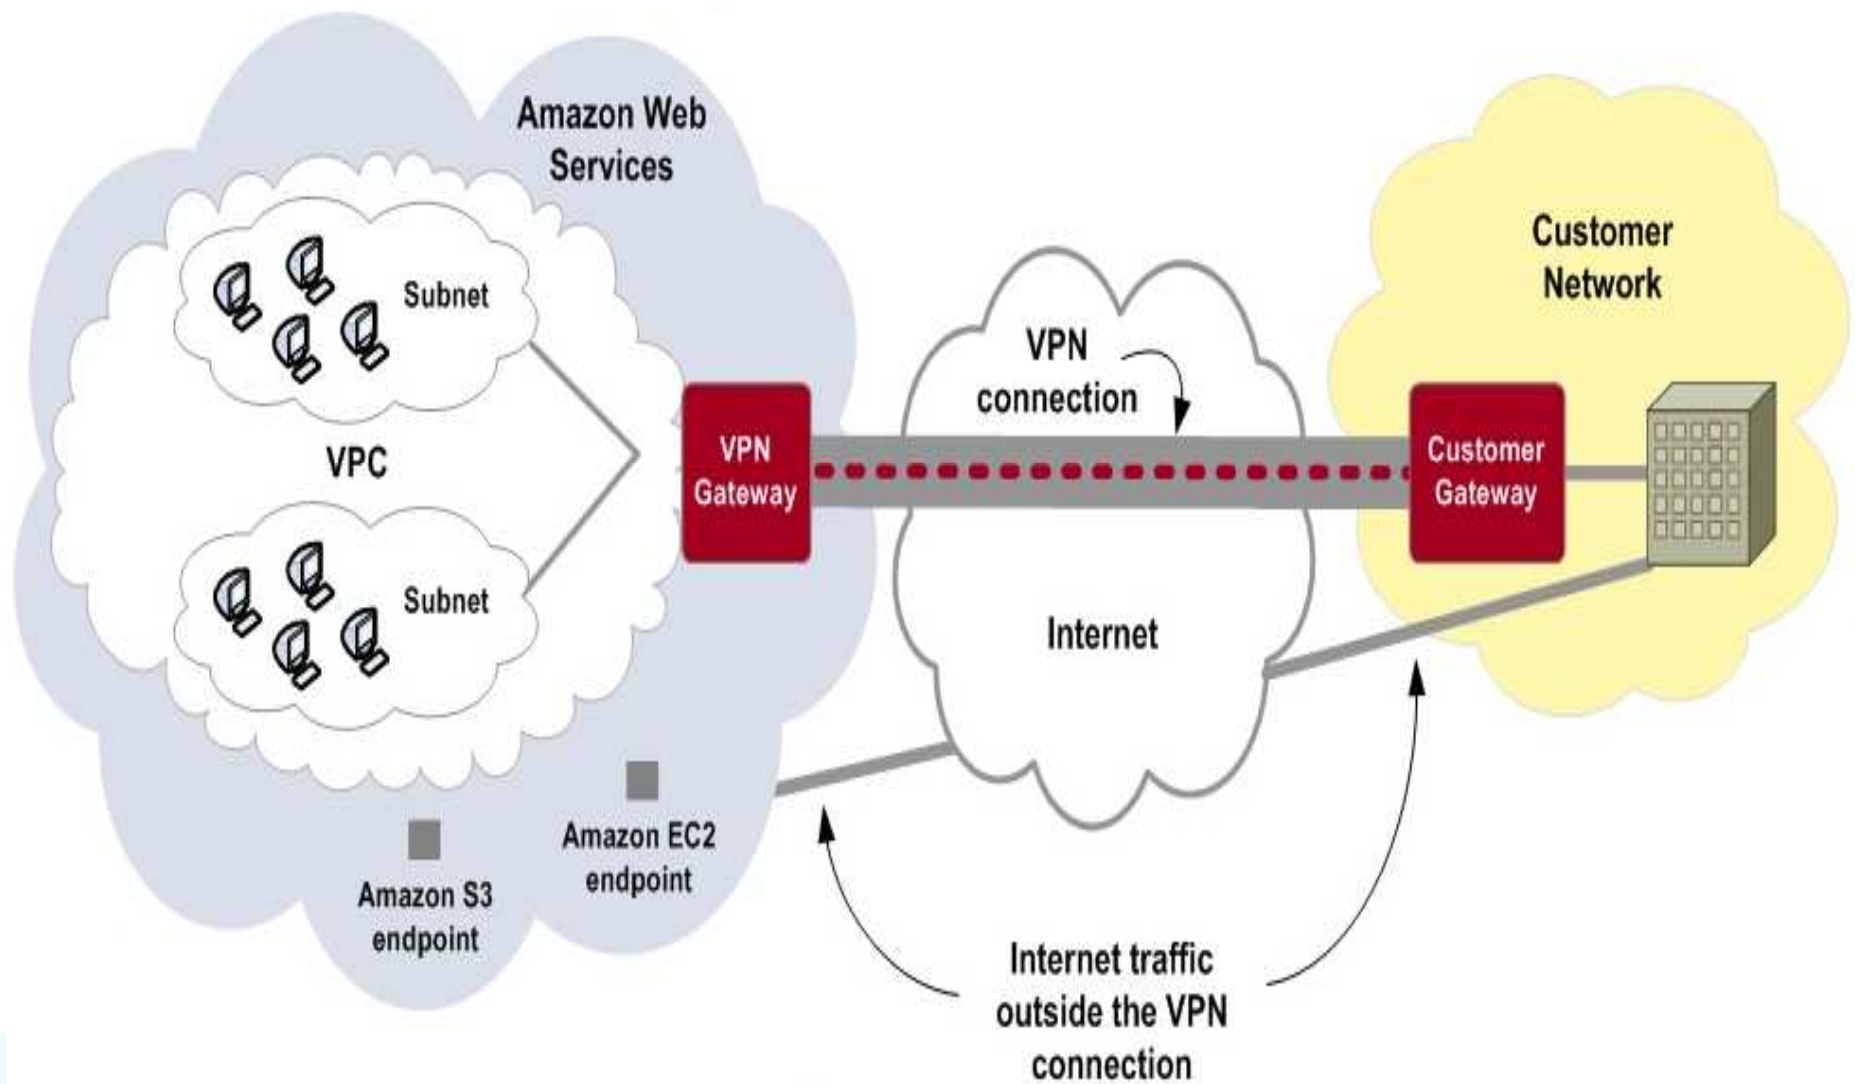

- They may **impact** the **cloud standardization**, while retaining greater **customization** and **organizational control**.

Private Cloud Diagram

Virtual Private Cloud Computing-
Designed & configured based off the needs
of the company.

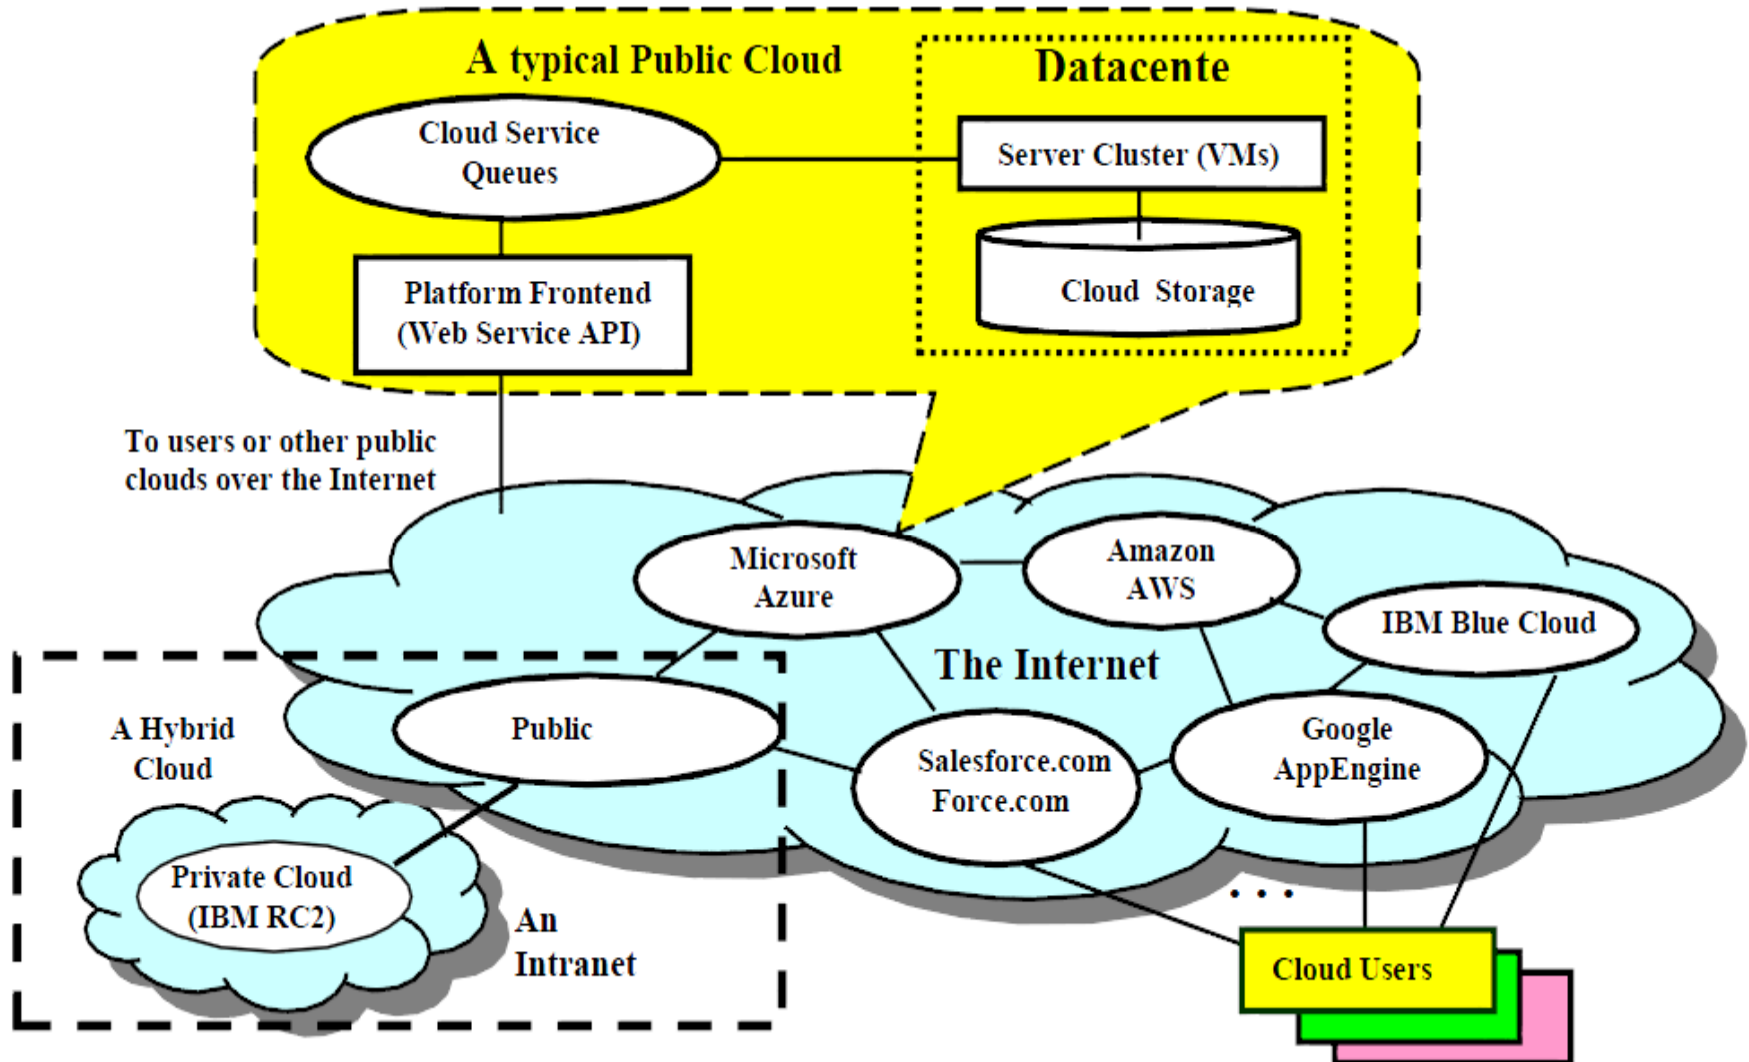

Amazon's Private Cloud

Hybrid Cloud

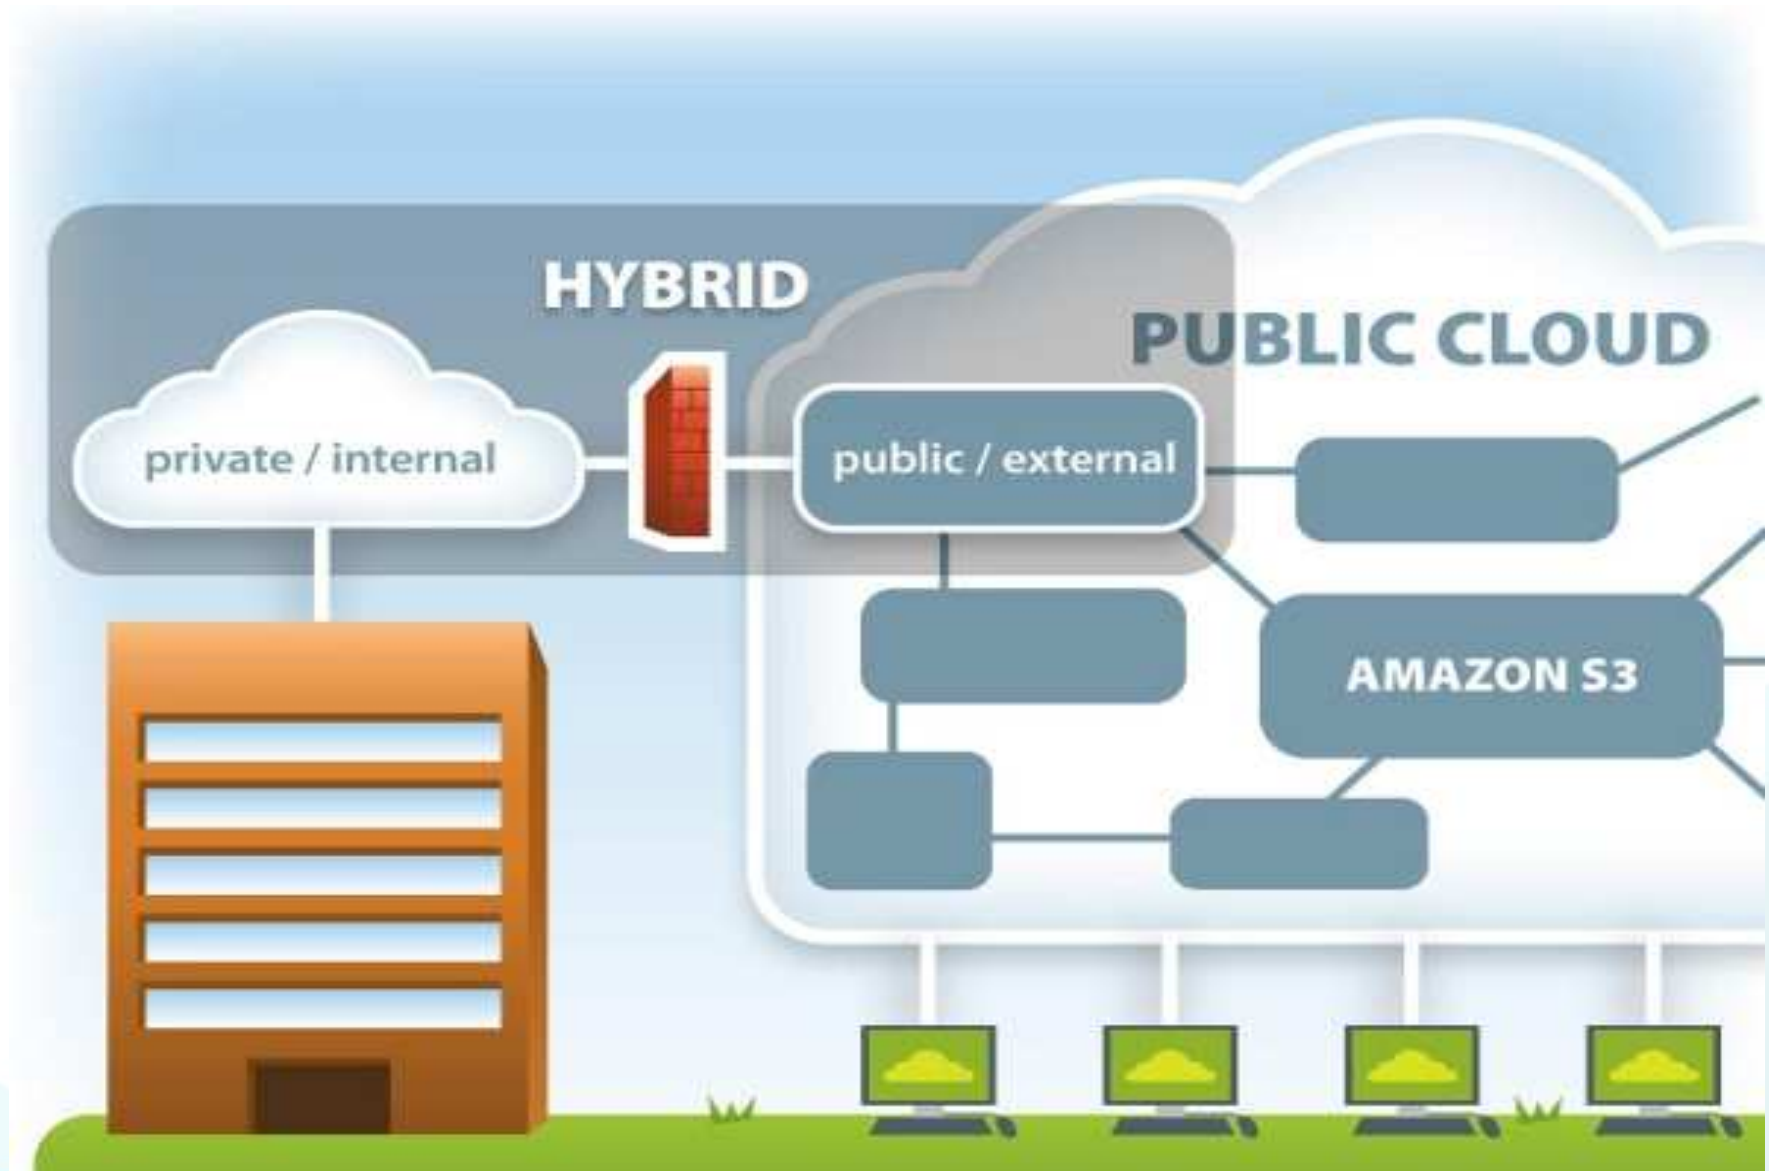

- Hybrid cloud is built with both public and private clouds
- Private clouds can also support a hybrid cloud model by supplementing local infrastructure with computing capacity from an external public cloud.
- For example, the Research compute cloud (RC2) is a private cloud built by IBM.
- The RC2 interconnects the computing and IT resources at 8 IBM Research Centers scattered in US, Europe, and Asia.

Public Clouds vs. Private Clouds

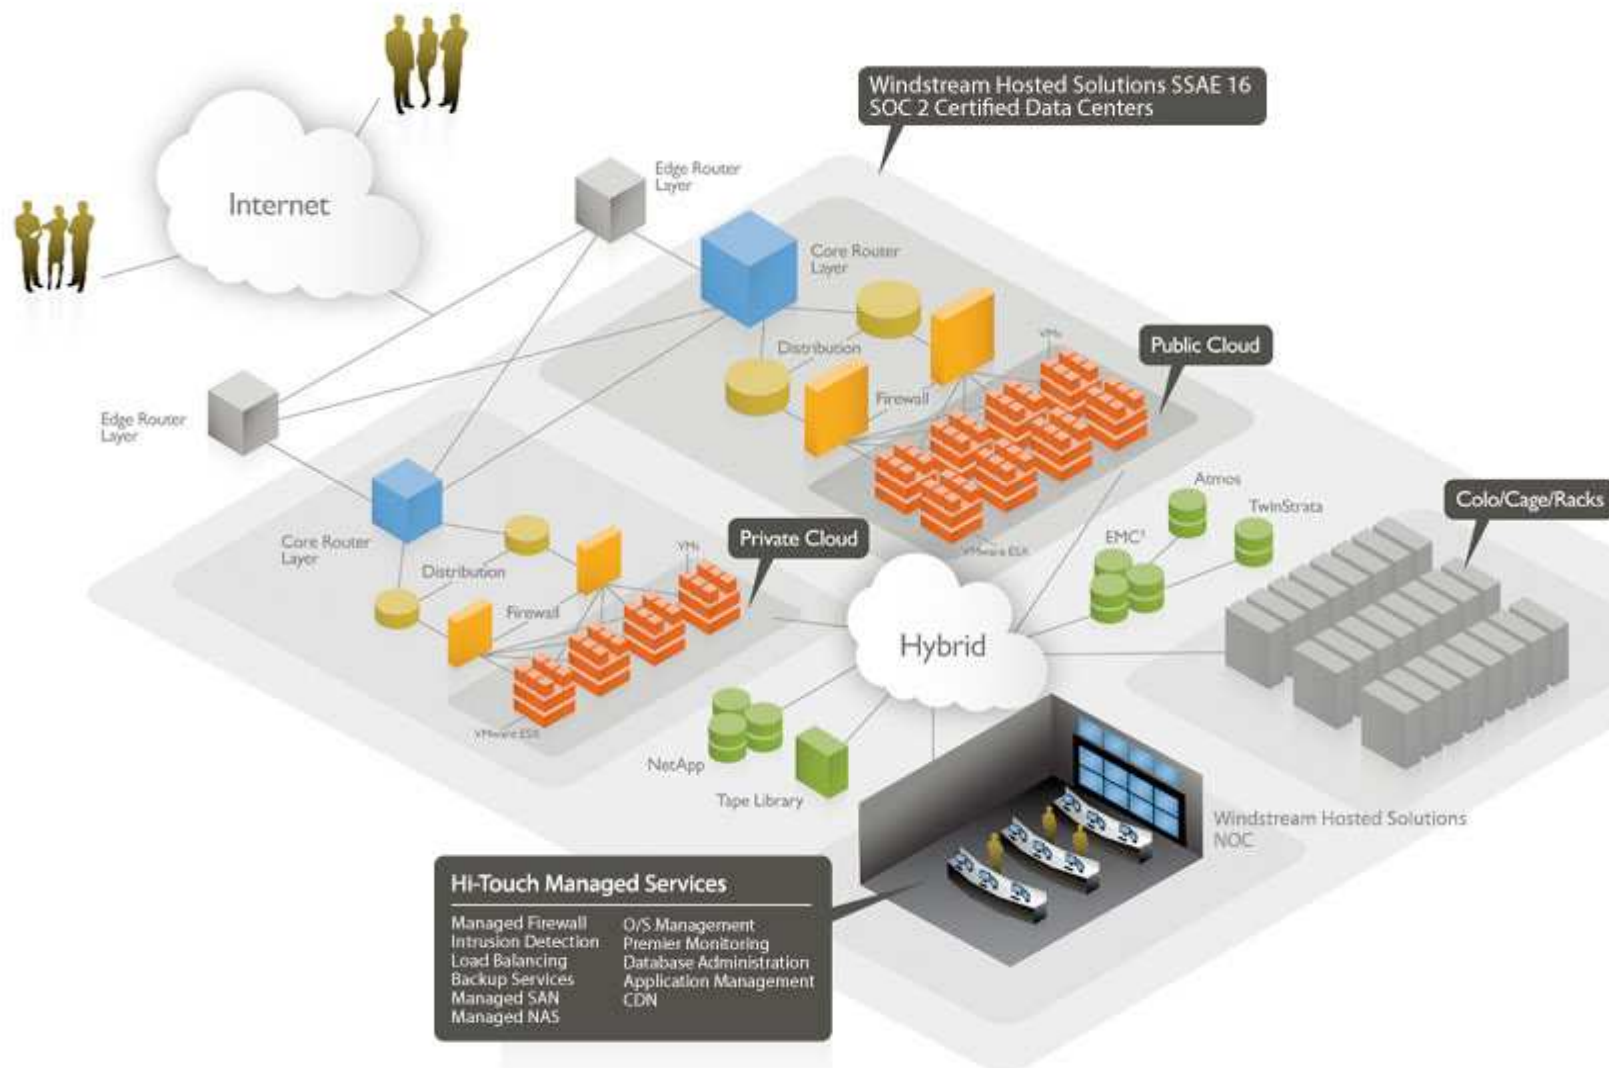

Public, private, and hybrid clouds over the Internet and intranets. The callout box shows the architecture of a typical public cloud. A private cloud is built within an intranet. A hybrid cloud involves both public and private clouds in its range. Users access the clouds from a web browser or through an special application programming interface (API).

Private, Public and Hybrid Cloud

Private, Public and Hybrid Cloud

Community Cloud

- **Community cloud:** Cloud **infra-structure** is **shared** by **several organizations** or **community** of people who have **same vision**, **security requirements** and **policy**.
- It may be **managed** by an **organization** or **third-party**.

Summary of Cloud Deployment Models

- **Public** clouds promotes
Standardization,
Preserves capital investment,
Offers application flexibility.
- **Private** clouds attempt to
Achieve customization and
Offer higher efficiency,
Resiliency, Security, and Privacy.
- **Hybrid** clouds operates in the middle way with compromises

Public Clouds vs. Private Clouds

Characteristics	Public clouds	Private clouds
Technology leverage and ownership	Owned by service providers	Leverage existing IT infrastructure and personnel; owned by individual organization
Management of provisioned resources	Creating and managing VM instances within proprietary infrastructure; promote standardization, preserves capital investment, application flexibility	Client managed; achieve customization and offer higher efficiency
Workload distribution methods and loading policies	Handle workload without communication dependency; distribute data and VM resources; surge workload is off-loaded	Handle workload dynamically, but can better balance workloads; distribute data and VM resources
Security and data privacy enforcement	Publicly accessible through remote interface	Access is limited; provide pre-production testing and enforce data privacy and security policies
Example platforms	Google App Engine, Amazon AWS, Microsoft Azure	IBM RC2

PUBLIC vs. PRIVATE vs. HYBRID CLOUD STORAGE

Characteristic	Public cloud storage	Private cloud storage	Hybrid cloud storage
Scalability	Very high	Limited	Very high
Security	Good, but depends on the security measures of the service provider	Most secure, as all storage is on-premise	Very secure; integration options add an additional layer of security
Performance	Low to medium	Very good	Good, as active content is cached on-premise
Reliability	Medium; depends on Internet connectivity and service provider availability	High, as all equipment is on premise	Medium to high, as cached content is kept on-premise, but also depends on connectivity and service provider availability
Cost	Very good; pay-as-you-go model and no need for on-premise storage infrastructure	Good, but requires on-premise resources, such as data center space, electricity and cooling	Improved, since it allows moving some storage resources to a pay-as-you-go model

Cost-Effectiveness in Cloud Computing vs. Datacenter Utilization

(Courtesy of M. Ambrust, et al 2009)

$$\text{UserHours}_{\text{cloud}} \times (\text{revenue} - \text{Cost}_{\text{cloud}}) \geq$$

$$\text{UserHours}_{\text{datacenter}} \times \left(\text{revenue} - \frac{\text{Cost}_{\text{datacenter}}}{\text{Utilization}} \right)$$

(a) Traditional IT cost model

(b) Cloud computing cost model

Cloud Service Models

Mainly are 3 Service models

1. Infra-structure as a Service (IaaS)
2. Platform as a Service (PaaS)
3. Software as a Service (SaaS)

Cloud Service Models

- Cloud computing delivers **infrastructure**, **platform**, and **software** (application) as services
- Available as subscription-based services in a pay-as-you-go model to consumers.
- All the three models allow the user to **access** the **services** over the **Internet**, **relying** entirely on the **infrastructures** of the **cloud service providers**
- These models are offered based on various **SLAs** between the **providers** and **Consumers**.
- The SLA for cloud computing is addressed in terms of the **service availability performance** and **data protection** and **security** aspects

Infra-structure as a Service (IaaS)

- This model allows users to rent **processing, storage, networks**, and other **resources**.
- The user can **deploy** and **run** the **guest OS** and **applications**.
- The user **does not** manage or control the **underlying** cloud **infrastructure** but has **control** over **OS, storage, deployed applications**, and possibly select networking components.
- This IaaS model encompasses the **storage** as a **service**, **computation resource** as a **service**, and **communication** resource as a **service**

Amazon's Virtual Private Cloud Infra-structure as a Service (IaaS)

Example for Infra-structure as a Service (IaaS)

Amazon's VPC for Multiple Tenants

- **Virtual Private Cloud (VPC)** is designed to address **privacy** concerns of **public** cloud that hamper application when **sensitive data** or software are involved.
- VPC allows users to **isolate** their provisioned AWS processor, memory and storage from **other** users.
- **Auto-scaling** : enables users to **automatically scale** their **VM instances** capacity **up** or **down**.
- Auto-scaling ensures **sufficient number** of Amazon EC2 instances are **provisioned** to meet desired performance.
- Or **scale down** the VM instance capacity to reduce cost when **workload** is **reduced**.

Amazon offers below (IaaS) Services

- **EC2 (Elastic compute cloud)** allows users to rent **virtual computers** to run their own computer applications.
- **S3 (simple storage service)** provides the object-oriented **storage** service for users.
- **EBS (Elastic block service)** provides the **block storage** interface.
- **Amazon DevPay** is a simple to use online **billing** and **account** management service.
- **MPI** clusters uses **hardware-assisted virtualization** instead of paravirtualization.
- **AWS import/export** allows **shipping data** to and from EC2.
- **CloudWatch** monitors **running** instances.
- **Amazon CloudFront** implements a **content distribution** network.

Amazon Web Services

FIGURE 4.21

Amazon cloud computing infrastructure (Key service is identified here; many more are listed in Table 4.5).

Amazon Web Services

Compute

Amazon Elastic Compute Cloud (EC2)
Amazon Elastic MapReduce
Auto Scaling

Content Delivery

Amazon CloudFront

Database

Amazon SimpleDB
Amazon Relational Database Service (RDS)

E-Commerce

Amazon Fulfillment Web Service (FWS)

Messaging

Amazon Simple Queue Service (SQS)
Amazon Simple Notification Service (SNS)

Monitoring

Amazon CloudWatch

Networking

Amazon Virtual Private Cloud (VPC)
Elastic Load Balancing

Payments & Billing

Amazon Flexible Payments Service (FPS)
Amazon DevPay

Storage

Amazon Simple Storage Service (S3)
Amazon Elastic Block Storage (EBS)
AWS Import/Export

Support

AWS Premium Support

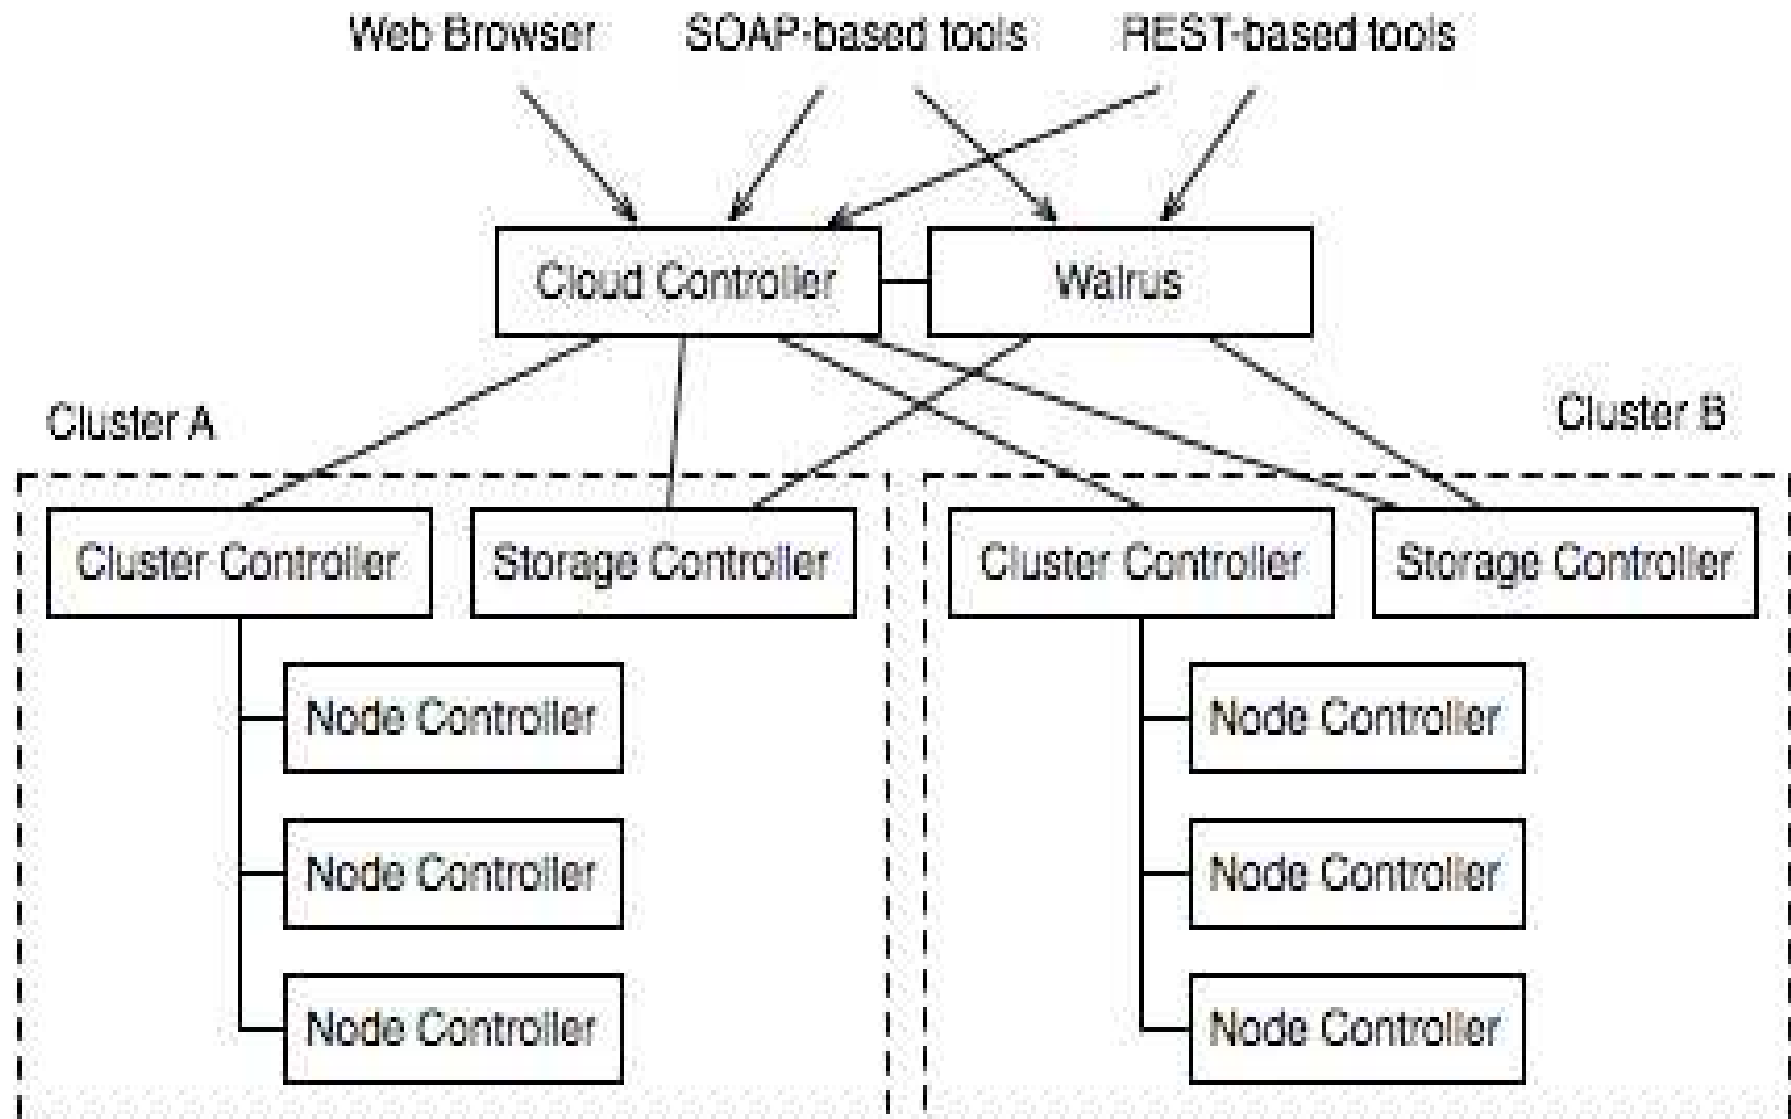

Web Traffic

Alexa Web Information Service
Alexa Top Sites

Workforce

Eucalyptus Private Cloud

Eucalyptus Private Cloud

Eucalyptus Private Cloud

Cloud and Cluster Start

```
[root@front ~]# service eucalyptus-cloud start
```

```
Starting Eucalyptus services:
```

```
Eucalyptus services are already running!
```

```
[root@front ~]# service eucalyptus-cc start
```

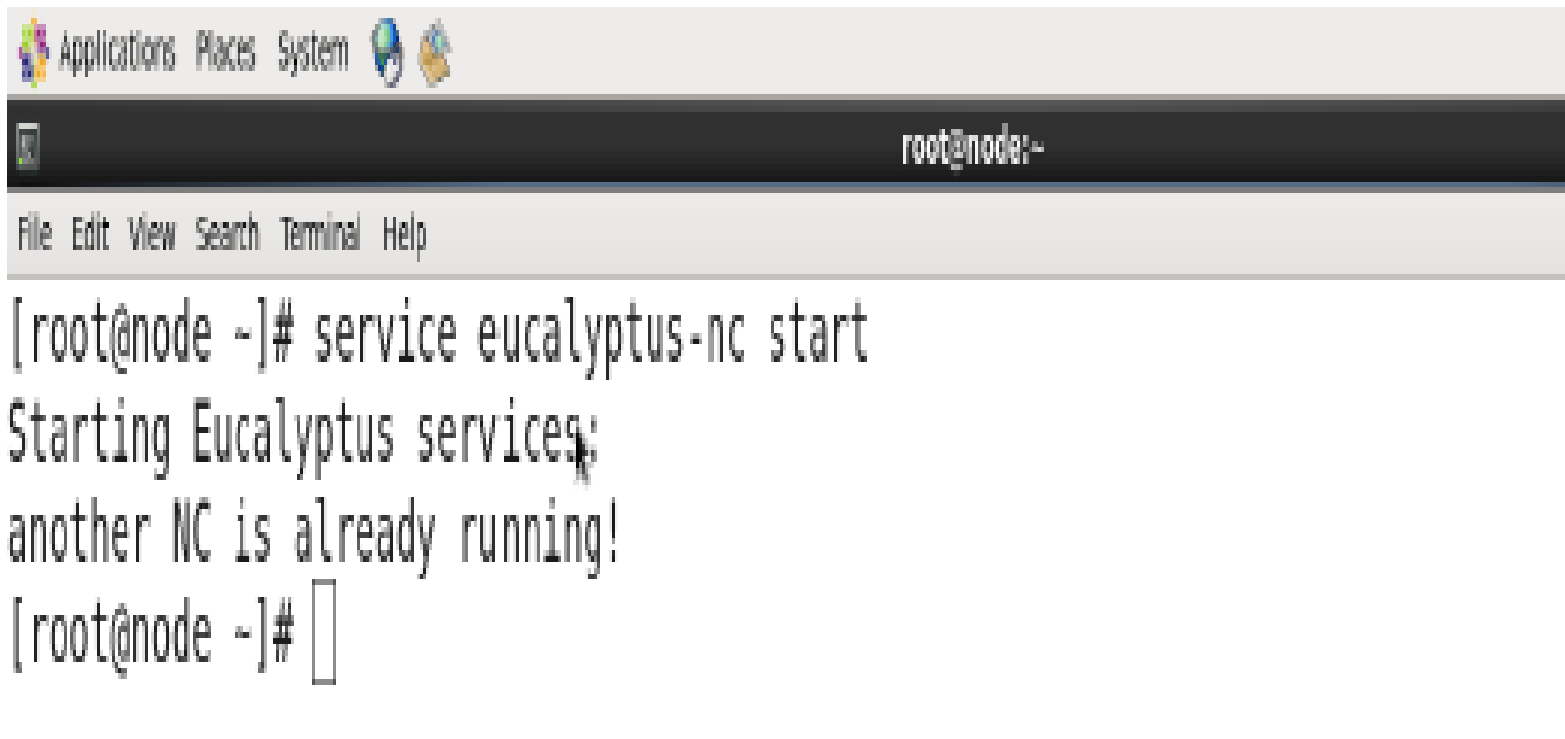

```
Starting Eucalyptus cluster controller:
```

```
another CC is already running!
```

```
[root@front ~]#
```

Eucalyptus Private Cloud

On Node Controller: Service eucalyptus-nc start

A screenshot of a Linux terminal window. The window has a title bar with 'Applications Places System' and two icons. Below the title bar is a dark bar with the text 'root@node:~'. The terminal content shows the command '[root@node ~]# service eucalyptus-nc start' being entered, followed by the output 'Starting Eucalyptus services:' and 'another NC is already running!'. The prompt '[root@node ~]#' is shown again at the end.

```
[root@node ~]# service eucalyptus-nc start
Starting Eucalyptus services:
another NC is already running!
[root@node ~]#
```

Some IaaS Offerings from Public Clouds :

Table 4.1 Public Cloud Offerings of IaaS [10,18]

Cloud Name	VM Instance Capacity	API and Access Tools	Hypervisor, Guest OS
Amazon EC2	Each instance has 1–20 EC2 processors, 1.7–15 GB of memory, and 160–1.69 TB of storage.	CLI or Web Service (WS) portal	Xen, Linux, Windows
GoGrid	Each instance has 1–6 CPUs, 0.5–8 GB of memory, and 30–480 GB of storage.	REST, Java, PHP, Python, Ruby	Xen, Linux, Windows
Rackspace Cloud	Each instance has a four-core CPU, 0.25–16 GB of memory, and 10–620 GB of storage.	REST, Python, PHP, Java, C#, .NET	Xen, Linux
FlexiScale in the UK	Each instance has 1–4 CPUs, 0.5–16 GB of memory, and 20–270 GB of storage.	Web console	Xen, Linux, Windows
Joyent Cloud	Each instance has up to eight CPUs, 0.25–32 GB of memory, and 30–480 GB of storage.	No specific API, SSH, Virtual/Min	OS-level virtualization, OpenSolaris

Platform as a Service (PaaS)

- User can develop, deploy, and manage execution of applications using basic capabilities offered under IaaS model.
- But it is very complex to do so due to **lack** of **platform** and required **tools**.
- Platform includes **operating system** and **run time library** support.
- PaaS provides such platform and enables users to **develop** and **deploy** their applications
- User application can be developed on **virtualized** cloud **platform** using **programming languages** and **software tools** such as **Java**, **Python**, **.NET**, **RUBY**, **Perl**, **R**, **Hive** etc...

Platform as a Service (PaaS)

- The **user** does **not manage** the underlying cloud **infrastructure**.
- The cloud provider facilitates to support the **entire application development, testing and operation** support.
- Enables **third party** to provide **software management, integration and service monitoring** solutions
- Cloud services offered under PaaS model includes **Google App Engine, Microsoft Azure, and Manjrasoft Aneka**

Google App Engine (GAE) Platform as a Service (PaaS)

Google App Engine (GAE) Platform as a Service (PaaS)

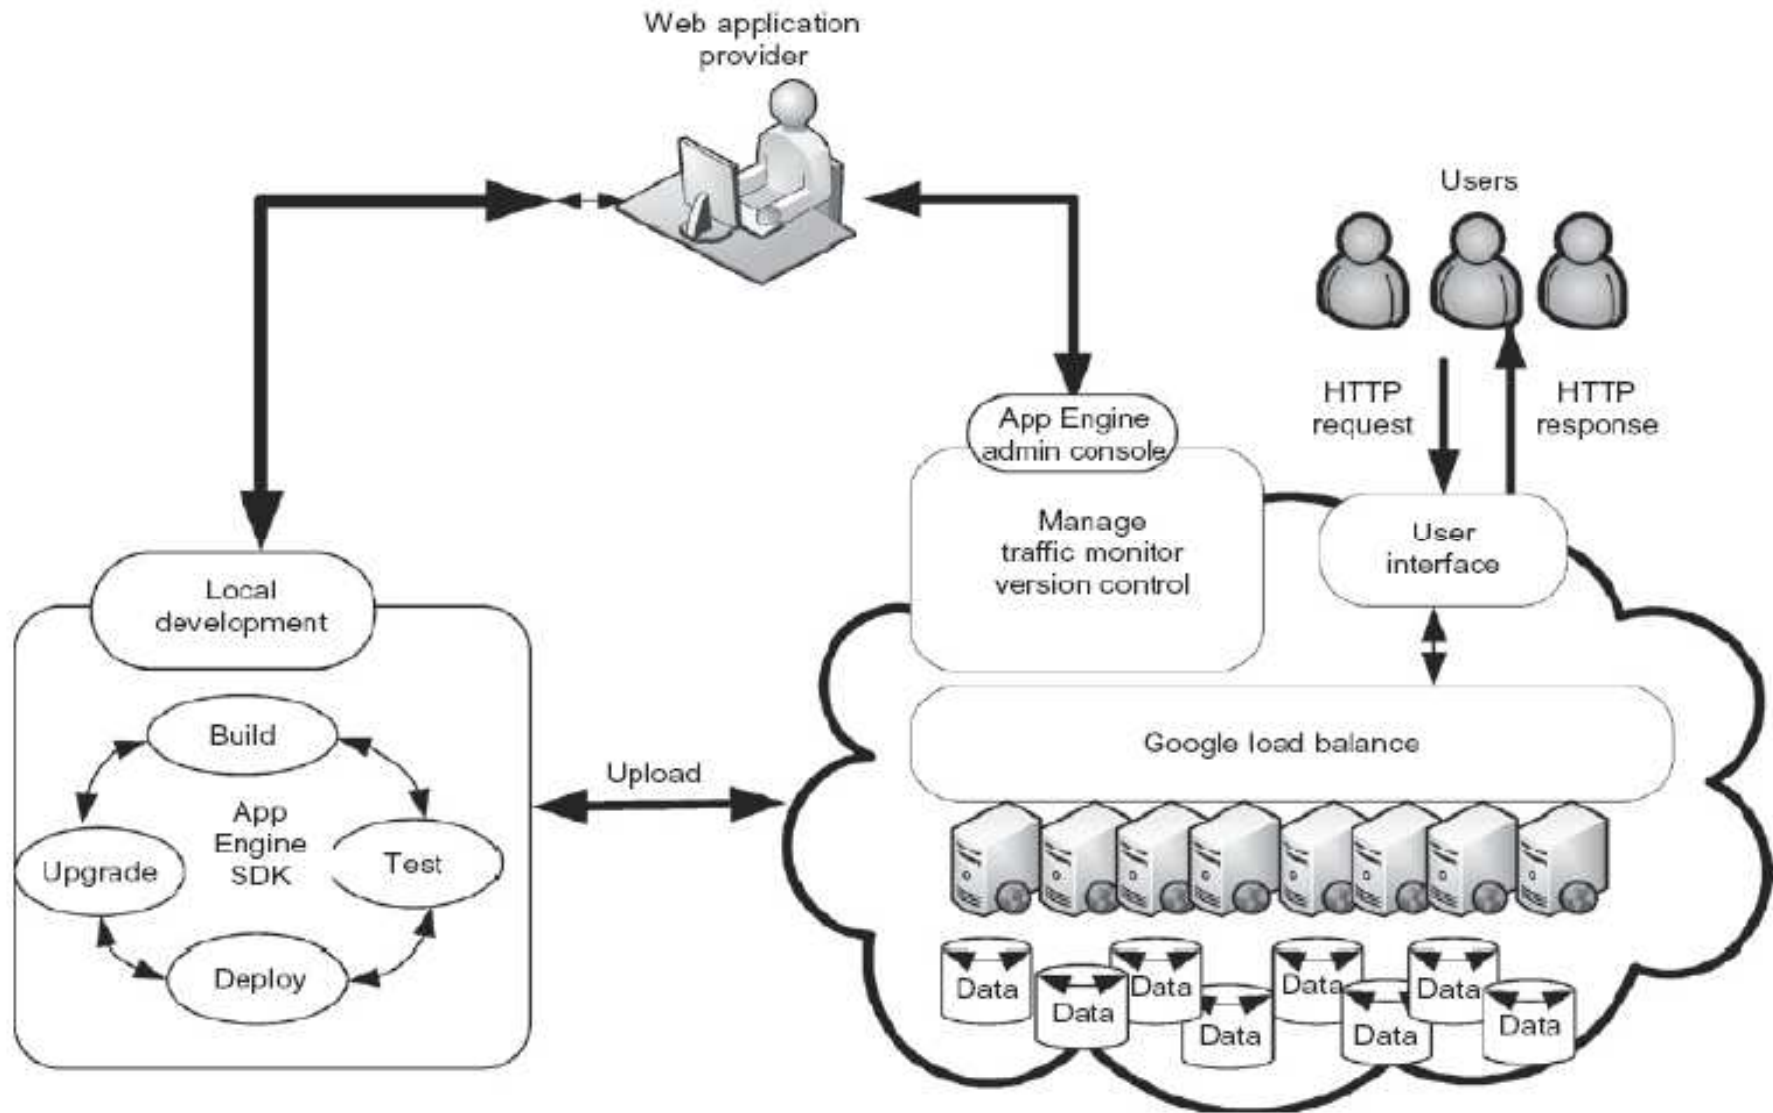

FIGURE 4.7

Google App Engine platform for PaaS operations.

Example for Platform as a Service (PaaS)

Google App Engine

- **Web applications** are running on a **Google's server cluster**.
- Application has features such as **automatic scaling** and **load balancing** which are convenient for building applications.
- Google provides **fully featured local development environment** that simulates GAE in **developer's computer**.
- All **functions**, and **application logic** are implemented locally. Coding and **debugging** are **performed locally**.
- **SDK** provides a **tool** for **uploading** the **user's application** to **Google Infrastructure**.

Microsoft Windows Azure Platform as a Service (PaaS)

- Windows Azure offers a cloud platform built on Windows OS and based on MS virtualization technologies.
- All cloud services can interact with traditional MS software applications such as Windows Live, Office Live, Exchange Online, SharePoint online, Dynamic CRM online.
- The Azure platform applies the standard web communication protocols SOAP and REST

Microsoft Windows Azure Platform as a Service (PaaS)

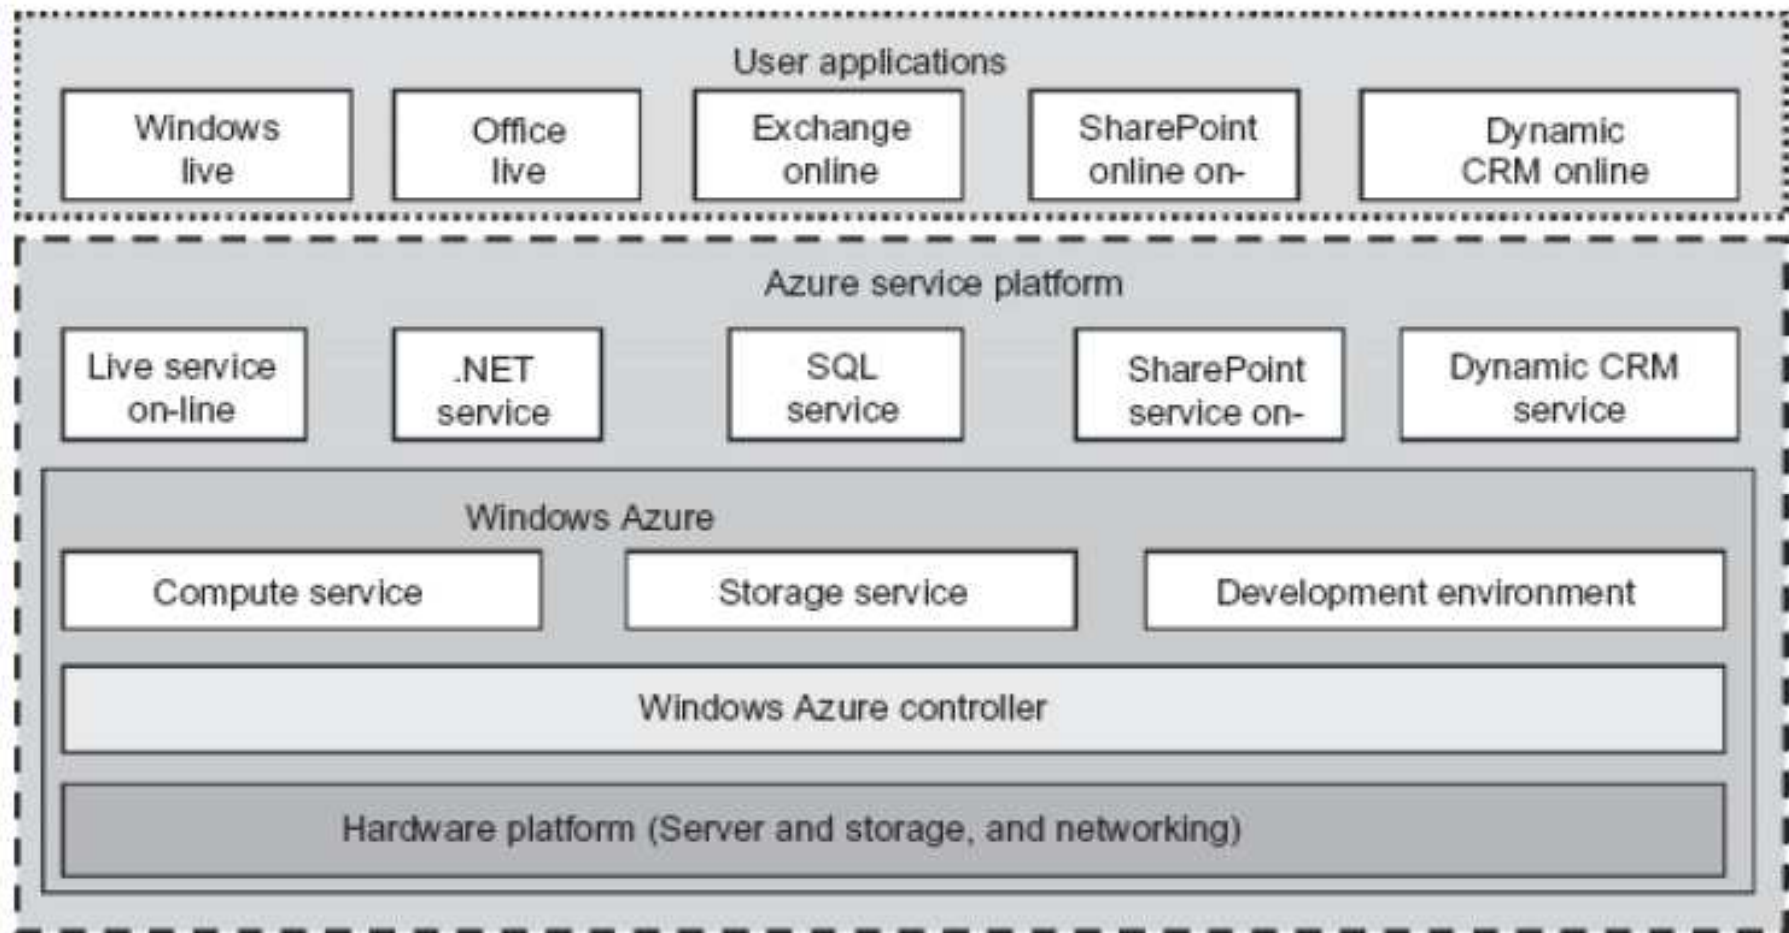

FIGURE 4.22

Microsoft Windows Azure platform for cloud computing.

(Courtesy of Microsoft, 2010, <http://www.microsoft.com/windowsazure>)

Microsoft Windows Azure Platform as a Service (PaaS)

- *Live service* : Users can visit Microsoft Live applications and apply the data involved across multiple machines concurrently.
- *.NET service* : This package supports the application development on local hosts and the execution on the cloud machines.
- *SQL Azure* : This function facilitates users to visit and use the relational database associated with the SQL server in the cloud.
- *SharePoint service*: This provides a scalable and manageable platform for users to develop their special business applications in upgraded Web services.
- *Dynamic CRM service*: This provides software developers a business platform in managing CRM applications in financing, marketing, sales and promotions, etc.

PaaS Offerings from Public Clouds

Table 4.2 Five Public Cloud Offerings of PaaS [10,18]

Cloud Name	Languages and Developer Tools	Programming Models Supported by Provider	Target Applications and Storage Option
Google App Engine	Python, Java, and Eclipse-based IDE	MapReduce, Web programming on demand	Web applications and BigTable storage
Salesforce.com's Force.com	Apex, Eclipse-based IDE, Web-based Wizard	Workflow, Excel-like formula, Web programming on demand	Business applications such as CRM
Microsoft Azure	.NET, Azure tools for MS Visual Studio	Unrestricted model	Enterprise and Web applications
Amazon Elastic MapReduce	Hive, Pig, Cascading, Java, Ruby, Perl, Python, PHP, R, C++	MapReduce	Data processing and e-commerce
Aneka	.NET, stand-alone SDK	Threads, task, MapReduce	.NET enterprise applications, HPC

Software as a Service (SaaS)

- This refers to **browser-initiated application** software over thousands of cloud customers.
- Services and tools offered by PaaS are utilized in **construction of applications** and management of their deployment on resources offered by IaaS providers.
- SaaS model provides the **software applications** as a service.
- As a result, on the **customer side**, there is **no upfront investment** in servers or **software licensing**.
- On the provider side, **costs** are rather **low**, compared with **conventional hosting** of user applications.

Software as a Service (SaaS)

- Examples: Google Gmail, Google Docs, Microsoft online sharepoint and CRM software from Salesforce.com
- Providers such as Google and Microsoft offer integrated IaaS and PaaS services.
- Amazon and GoGrid offer pure IaaS services and expect third parties PaaS providers such as Manjrasoft to offer application development and deployment services on top of their infrastructure services.

Cloud Platforms and Services

Table 4.5 Five Major Cloud Platforms and Their Service Offerings [30]

Model	IBM	Amazon	Google	Microsoft	Salesforce
PaaS	BlueCloud, WCA, RC2		App Engine (GAE)	Windows Azure	Force.com
IaaS	Ensembles	AWS		Windows Azure	
SaaS	Lotus Live		Gmail, Docs	.NET service, Dynamic CRM	Online CRM, Gifttag
Virtualization		OS and Xen	Application Container	OS level/ Hypel-V	
Service Offerings	SOA, E2, TSAM, RAD, Web 2.0	EC2, S3, SQS, SimpleDB	GFS, Chubby, BigTable, MapReduce	Live, SQL Hotmail	Apex, visual force, record security
Security Features	WebSphere2 and PowerVM tuned for protection	PKI, VPN, EBS to recover from failure	Chubby locks for security enforcement	Replicated data, rule- based access control	Admin./record security, uses metadata API
User Interfaces		EC2 command-line tools	Web-based admin console	Windows Azure portal	
Web API	Yes	Yes	Yes	Yes	Yes
Programming Support	AMI		Python	.NET Framework	

Note: WCA: WebSphere CloudBurst Appliance; RC2: Research Compute Cloud; RAD: Rational Application Developer; SOA: Service-Oriented Architecture; TSAM: Tivoli Service Automation Manager; EC2: Elastic Compute Cloud; S3: Simple Storage Service; SQS: Simple Queue Service; GAE: Google App Engine; AWS: Amazon Web Services; SQL: Structured Query Language; EBS: Elastic Block Store; CRM: Consumer Relationship Management.

Cloud Computing as A Service

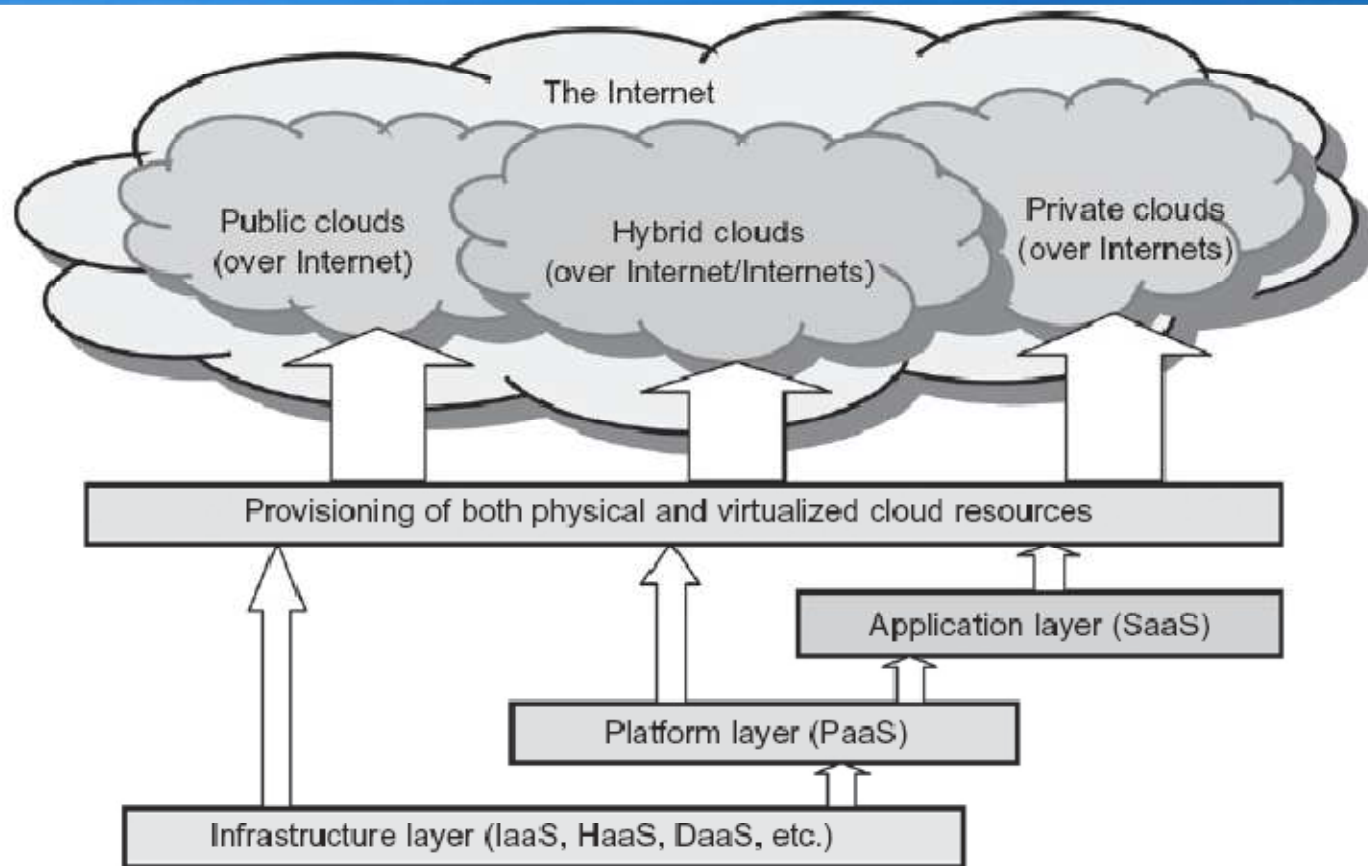

FIGURE 4.15

Layered architectural development of the cloud platform for IaaS, PaaS, and SaaS applications over the Internet.

Public Clouds and Service Offerings

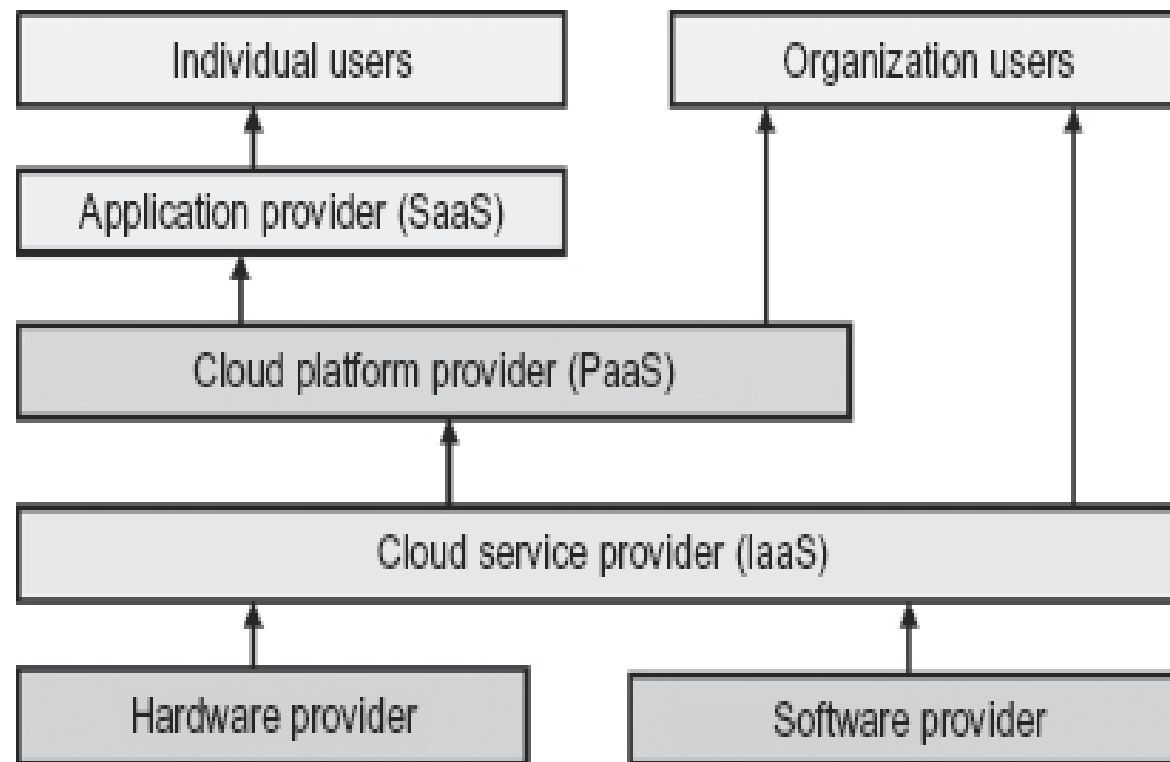

FIGURE 4.19

Roles of individual and organizational users and their interaction with cloud providers under various cloud service models.

Challenges in Cloud Computing (1)

- Concerns from The Industry (**Providers**)

- **Replacement Cost**

- Exponential increase in cost to maintain the infrastructure

- **Vendor Lock-in**

- No standard API or protocol can be very serious

- **Standardization**

- No standard metric for QoS is limiting the popularity

- **Security and Confidentiality**

- Trust model for cloud computing

- **Control Mechanism**

- Users do not have any control over infrastructures

Challenges in Cloud Computing (2)

- Concerns from **Research Community** :

- **Conflict to legacy programs**

- With difficulty in developing a new application due to lack of control

- **Provenance**

- How to reproduce results in different infrastructures

- **Reduction in Latency**

- No specially designed interconnect used
- Very low controllability in layout of interconnect due to abstraction

- **Programming Model**

- Hard to debug where programming naturally error-prone
- Details about infrastructure are hidden

- **QoS Measurement**

- Especially for ubiquitous computing where context changes

Security and Trust Barriers in Cloud Computing

- Protecting datacenters must first secure cloud resources and uphold user privacy and data integrity.
- Trust overlay networks could be applied to build reputation systems for establishing the trust among interactive datacenters.
- A watermarking technique is suggested to protect shared data objects and massively distributed software modules.
- These techniques safeguard user authentication and tighten the data access-control in public clouds.
- The new approach could be more cost-effective than using the traditional encryption and firewalls to secure the clouds.

Inter-Cloud or Mashup Services

(Cloudbus Project at the University of Melbourne)

Summary

- Cloud Deployment Models
 - Public Cloud
 - Private Cloud
 - Hybrid Cloud
 - Community Cloud
- Cloud Ecosystem
- Cloud Service Models
 - Infra-structure as a Service (IaaS)
 - Platform as a Service (PaaS)
 - Software as a Service (SaaS)
- Cloud Computing Challenges
