

---

# Firewalls

# Introduction

---

- ▶ seen evolution of information systems
- ▶ now everyone want to be on the Internet
- ▶ and to interconnect networks
- ▶ has persistent security concerns
  - ▶ can't easily secure every system in org
- ▶ need "harm minimisation"
- ▶ a **Firewall** usually part of this

# What is a Firewall?

---

- ▶ a **choke point** of control and monitoring
- ▶ interconnects networks with differing trust
- ▶ imposes restrictions on network services
  - ▶ only authorized traffic is allowed
- ▶ auditing and controlling access
  - ▶ can implement alarms for abnormal behavior
- ▶ is itself immune to penetration
- ▶ provides **perimeter defence**

# Firewall Limitations

---

- ▶ cannot protect from attacks bypassing it
  - ▶ eg sneaker net, utility modems, trusted organisations, trusted services (eg SSL/SSH)
- ▶ cannot protect against internal threats
  - ▶ eg disgruntled employee
- ▶ cannot protect against transfer of all virus infected programs or files
  - ▶ because of huge range of O/S & file types

# Firewalls – Packet Filters

---

(a) Packet-filtering router

# Firewalls – Packet Filters

---

- ▶ simplest of components
- ▶ foundation of any firewall system
- ▶ examine each IP packet (no context) and permit or deny according to rules
- ▶ hence restrict access to services (ports)
- ▶ possible default policies
  - ▶ that not expressly permitted is prohibited
  - ▶ that not expressly prohibited is permitted

# Firewalls – Packet Filters

Table 20.1 Packet-Filtering Examples

**A**

action	ourhost	port	theirhost	port	comment
block	*	*	SPIGOT	*	we don't trust these people
allow	OUR-GW	25	*	*	connection to our SMTP port

**B**

action	ourhost	port	theirhost	port	comment
block	*	*	*	*	default

**C**

action	ourhost	port	theirhost	port	comment
allow	*	*	*	25	connection to their SMTP port

**D**

action	src	port	dest	port	flags	comment
allow	{our hosts}	*	*	25		our packets to their SMTP port
allow	*	25	*	*	ACK	their replies

**E**

action	src	port	dest	port	flags	comment
allow	{our hosts}	*	*	*		our outgoing calls
allow	*	*	*	*	ACK	replies to our calls
allow	*	*	*	>1024		traffic to nonservers

# Attacks on Packet Filters

---

- ▶ IP address spoofing
  - ▶ fake source address to be trusted
  - ▶ add filters on router to block
- ▶ source routing attacks
  - ▶ attacker sets a route other than default
  - ▶ block source routed packets
- ▶ tiny fragment attacks
  - ▶ split header info over several tiny packets
  - ▶ either discard or reassemble before check

# Firewalls – Stateful Packet Filters

---

- ▶ examine each IP packet in context
  - ▶ keeps tracks of client-server sessions
  - ▶ checks each packet validly belongs to one
- ▶ better able to detect bogus packets out of context

# Firewalls - Application Level Gateway (or Proxy)

---

(b) Application-level gateway

# Firewalls - Application Level Gateway (or Proxy)

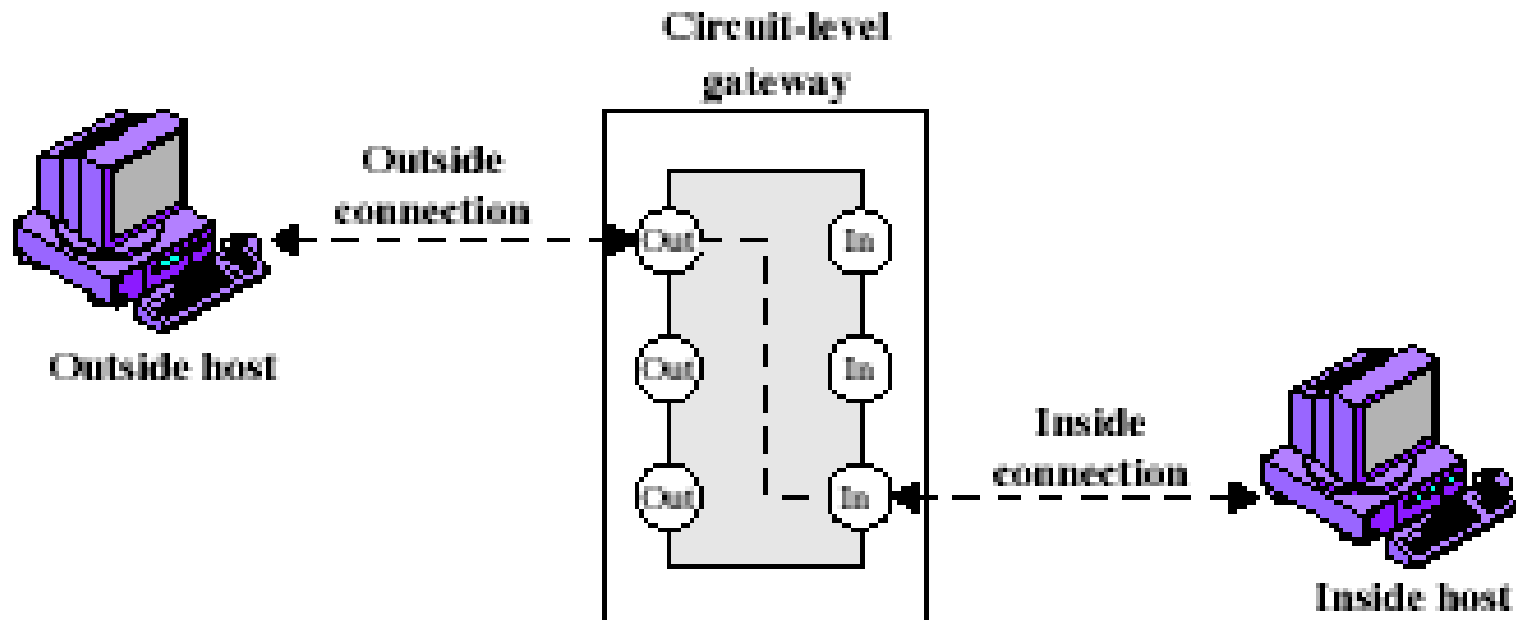

---

- ▶ use an application specific gateway / proxy
- ▶ has full access to protocol
  - ▶ user requests service from proxy
  - ▶ proxy validates request as legal
  - ▶ then actions request and returns result to user
- ▶ need separate proxies for each service
  - ▶ some services naturally support proxying
  - ▶ others are more problematic
  - ▶ custom services generally not supported

# Firewalls - Circuit Level Gateway

---

(c) Circuit-level gateway

# Firewalls - Circuit Level Gateway

---

- ▶ relays two TCP connections
- ▶ imposes security by limiting which such connections are allowed
- ▶ once created usually relays traffic without examining contents
- ▶ typically used when trust internal users by allowing general outbound connections
- ▶ SOCKS commonly used for this

# Bastion Host

---

- ▶ highly secure host system
- ▶ potentially exposed to "hostile" elements
- ▶ hence is secured to withstand this
- ▶ may support 2 or more net connections
- ▶ may be trusted to enforce trusted separation between network connections
- ▶ runs circuit / application level gateways
- ▶ or provides externally accessible services

# Firewall Configurations

(a) Screened host firewall system (single-homed bastion host)

# Firewall Configurations

(b) Screened host firewall system (dual-homed bastion host)

# Firewall Configurations

---

(c) Screened-subnet firewall system

# Access Control

---

- ▶ given system has identified a user
- ▶ determine what resources they can access
- ▶ general model is that of access matrix with
  - ▶ **subject** - active entity (user, process)
  - ▶ **object** - passive entity (file or resource)
  - ▶ **access right** – way object can be accessed
- ▶ can decompose by
  - ▶ columns as access control lists
  - ▶ rows as capability tickets

# Access Control Matrix

---

	Program1	...	SegmentA	SegmentB
Process1	Read Execute		Read Write	
Process2				Read
•				
•				
•				

# Trusted Computer Systems

---

- ▶ information security is increasingly important
- ▶ have varying degrees of sensitivity of information
  - ▶ cf military info classifications: confidential, secret etc
- ▶ subjects (people or programs) have varying rights of access to objects (information)
- ▶ want to consider ways of increasing confidence in systems to enforce these rights
- ▶ known as multilevel security
  - ▶ subjects have **maximum & current** security level
  - ▶ objects have a fixed security level **classification**

# Bell LaPadula (BLP) Model

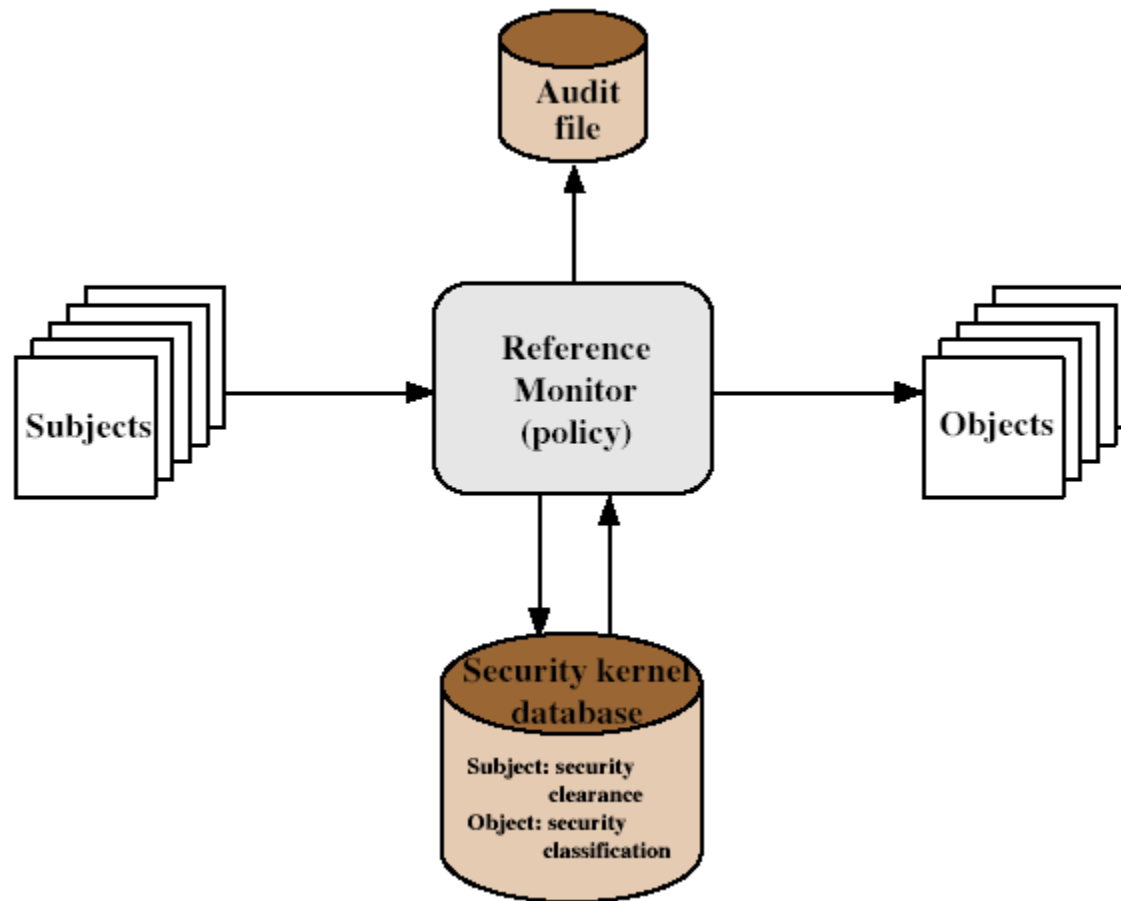

---

- ▶ one of the most famous security models
- ▶ implemented as mandatory policies on system
- ▶ has two key policies:
- ▶ **no read up** (simple security property)
  - ▶ a subject can only read/write an object if the current security level of the subject dominates ( $\geq$ ) the classification of the object
- ▶ **no write down** (\*-property)
  - ▶ a subject can only append/write to an object if the current security level of the subject is dominated by ( $\leq$ ) the classification of the object

# Reference Monitor

---

# Evaluated Computer Systems

---

- ▶ governments can evaluate IT systems
- ▶ against a range of standards:
  - ▶ TCSEC, IPSEC and now Common Criteria
- ▶ define a number of “levels” of evaluation with increasingly stringent checking
- ▶ have published lists of evaluated products
  - ▶ though aimed at government/defense use
  - ▶ can be useful in industry also

# Summary

---

- ▶ have considered:
  - ▶ firewalls
  - ▶ types of firewalls
  - ▶ configurations
  - ▶ access control
  - ▶ trusted systems
